Dundee Sustainable Technologies (CSE: DST) has leading innovations in mining processing after more than a decade of testing and data collection, President and CEO Jean-Philippe Mai says in a new video.

The Quebec-based company's GlassLock process safely removes and stabilizes arsenic, while its CLEVR technology improves metal recovery, Mai said this month at *The Northern Miner's* International Metals Symposium in London.

"We've definitely been focused on developing new processes because the processing landscape has not evolved a whole lot over almost 50 years," Mai said in conversation with *Northern Miner* podcast host Adrian Pocobelli. "We've really looked at how can we apply novel chemistry to increase efficiency."
